

REMARKS

New independent Claim 21 defines the invention as a holder for supporting an article that includes a body including a support surface that is adapted to support an article thereon and a sensor positioned relative to the body opposite the support surface. The sensor is adapted to generate a signal that is representative of a condition of an article supported on the support surface. A support member is supported on the body for movement relative thereto, and an actuator is responsive to the sensor signal for moving the support member into engagement with an article supported on the support surface.

None of the art of record shows or suggests this structure. Specifically, none of such art shows or suggests a holder for supporting an article that includes a body including a support surface that is adapted to support an article thereon and a sensor positioned relative to the body opposite the support surface that is adapted to generate a signal that is representative of a condition of an article supported on the support surface.

New independent Claim 29 defines the invention as a holder for supporting an article including a body including a support surface that extends generally horizontally and is adapted to support an article thereon. A sensor is adapted to generate a signal that is representative of a condition of an article supported on the support surface. A support member is supported on the body for pivoting movement about an axis that extends generally horizontally. Lastly, an actuator is responsive to the sensor signal for moving the support member into engagement with an article supported on the support surface.

None of the art of record shows or suggests this structure. Specifically, none of such art shows or suggests a holder for supporting an article that includes a body including a support surface that extends generally horizontally and is adapted to

support an article thereon and a support member that is supported on the body for pivoting movement about an axis that extends generally horizontally.

Respectfully submitted,

Richard S. MacMillan
